

## Wireshark SSL

[1] For each of the first 8 Ethernet frames, specify the source of the frame (client or server), determine the number of SSL records that are included in the frame, and list the SSL record types that are included in the frame. Draw a timing diagram between client and server, with one arrow for each SSL record.

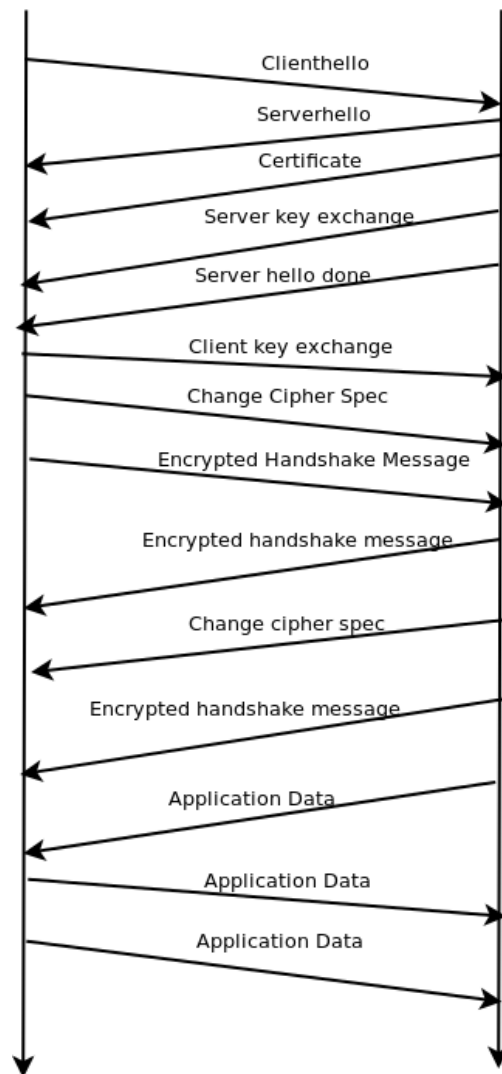

| Frame | Source | Number of SSLs | SSL Type  |
|-------|--------|----------------|---|
| 106   | Client | 1              | Client Hello  |
| 108   | Server | 1              | Server Hello  |
| 111   | Server | 2              | Certificate<br>Server Hello Done  |
| 112   | Client | 3              | Client Key Exchange<br>Change Cipher Spec<br>Encrypted Handshake<br>Message |
| 113   | Server | 2              | Change Cipher Spec<br>Encrypted Handshake<br>Message                        |
| 114   | Client | 1              | Application Data  |
| 122   | Server | 1              | Application Data  |
| 127   | Server | 1              | Application Data  |

The following diagram is generated by Wireshark Flow Graph, and it is not full graph.

The following diagram is drawn manually.

The left side is client, and the right side is server.

[2] Each of the SSL records begins with the same three fields (with possibly different values). One of these fields is “content type” and has length of one byte. List all three fields and their lengths.

Secure Sockets Layer

▼ SSLv3 Record Layer: Handshake Protocol: Server Hello

**Content Type: Handshake (22)**

Version: SSL 3.0 (0x0300)

Length: 74

Content Type : 1 byte  
 Version : 2 bytes  
 Length : 2 bytes

(Note that I only get all of those 3 fields in SSLv3, not SSLv2)

[3] Expand the ClientHello record. (If your trace contains multiple ClientHello records, expand the frame that contains the first one.) What is the value of the content type?

|     |           |                |                |       |      |                  |
|-----|-----------|----------------|----------------|-------|------|------------------|
| 163 | 23.566451 | 128.238.38.162 | 216.75.194.220 | SSLv3 | 156  | Client Hello     |
| 165 | 23.586650 | 216.75.194.220 | 128.238.38.162 | SSLv3 | 1329 | Application Data |
| 169 | 23.591590 | 216.75.194.220 | 128.238.38.162 | SSLv3 | 200  | Server Hello,    |

Checksum: 0xa3b1 [unverified]  
 [Checksum Status: Unverified]  
 Urgent pointer: 0  
 ▶ [SEQ/ACK analysis]

Secure Sockets Layer

▼ SSLv3 Record Layer: Handshake Protocol: Client Hello

Content Type: Handshake (22)

Version: SSL 3.0 (0x0300)  
 Length: 97  
 ▶ Handshake Protocol: Client Hello

Because frame 106 is SSLv2, thus I did not find any “Content type” field. Therefore, I choose frame 163, which is the 2<sup>nd</sup> Client Hello frame.

- The value is Handshake (is 22).

[4] Does the ClientHello record contain a nonce (also known as a “challenge”)? If so, what is the value of the challenge in hexadecimal notation?

|  |
|--|
| ▼ SSLv2 Record Layer: Client Hello                                     |
| [Version: SSL 2.0 (0x0002)]  |
| Length: 76   |
| Handshake Message Type: Client Hello (1)                               |
| Version: SSL 3.0 (0x0300)  |
| Cipher Spec Length: 51   |
| Session ID Length: 0   |
| Challenge Length: 16   |
| ▶ Cipher Specs (17 specs)  |
| Challenge  |
| 0020 c2 dc 08 df 01 bb 56 d2 08 c5 4c 9e 64 9f 50 18 .....V. ..L.d.P.  |
| 0030 ff ff e7 55 00 00 80 4c 01 03 00 00 33 00 00 00 ...U...L ....3... |
| 0040 10 00 00 04 00 00 05 00 00 0a 01 00 80 07 00 c0 .....             |

| 0080 89 46 99 09 .F..  |

Yes, it does. It is in frame 106 (the SSLv2 one).

The client hello challenge value is 66 df 78 4c 04 8c d6 04 35 dc 44 89 89 46 99 09

**[5] Does the ClientHello record advertise the cipher suites it supports? If so, in the first listed suite, what are the public-key algorithm, the symmetric-key algorithm, and the hash algorithm?**

Yes, it does.

|                           | Time      | Source         | Destination    | Protoc ▲ | Length | Info  |

|                           |           |                |                |          |        | Cipher Spec: TLS_RSA_EXPORT_WITH_RC2_CBC_40_MD5 (0x000006)      |
|                           |           |                |                |          |        | Cipher Spec: SSL2_RC4_128_EXPORT40_WITH_MD5 (0x020080)          |
|                           |           |                |                |          |        | Cipher Spec: SSL2_RC2_128_CBC_EXPORT40_WITH_MD5 (0x040080)      |
|                           |           |                |                |          |        | Cipher Spec: TLS_DHE_DSS_WITH_3DES_EDE_CBC_SHA (0x000013)       |
|                           |           |                |                |          |        | Cipher Spec: TLS_DHE_DSS_WITH_DES_CBC_SHA (0x000012)            |
|                           |           |                |                |          |        | Cipher Spec: TLS_DHE_DSS_EXPORT1024_WITH_DES_CBC_SHA (0x000063) |

The first listed suite:

- Public-key algorithm : RSA
- Symmetric-key algorithm : RC4
- Hash algorithm : MD5

**[6] Locate the ServerHello SSL record. Does this record specify a chosen cipher suite? What are the algorithms in the chosen cipher suite?**

The cipher suite uses

- RSA for public key crypto
- RC4 for the symmetric-key cipher

- MD5 hash algorithm.

```
Handshake Protocol: Server Hello
Handshake Type: Server Hello (2)
Length: 70
Version: SSL 3.0 (0x0300)
▶ Random
Session ID Length: 32
Session ID: 1bad05faba02ea92c64c54be4547c32f3e3d
Cipher Suite: TLS_RSA_WITH_RC4_128_MD5 (0x0004)
```

**[7] Does this record include a nonce? If so, how long is it? What is the purpose of the client and server nonces in SSL?**

▼ Random

GMT Unix Time: Jan 1, 1970 08:00:00.000000000 IDT  
Random Bytes: 42dbed248b8831d04cc98c26e5badc4e267c391944f0f070...

Yes, it includes a nonce in the Random field.

The nonce has length of 32 bits long:

- 28 bits for random data
- 4 bits for the time.

It is used to prevent a replay attack.

**[8] Does this record include a session ID? What is the purpose of the session ID?**

```
Handshake Protocol: Server Hello
Handshake Type: Server Hello (2)
Length: 70
Version: SSL 3.0 (0x0300)
▶ Random
Session ID Length: 32
Session ID: 1bad05faba02ea92c64c54be4547c32f3e3d
Cipher Suite: TLS_RSA_WITH_RC4_128_MD5 (0x0004)
```

It is a unique identifier for the SSL session.

The client may go back to the same session later by using the server provided session ID when it sends the ClientHello.

**[9] Does this record contain a certificate, or is the certificate included in a separated record. Does the certificate fit into a single Ethernet frame?**

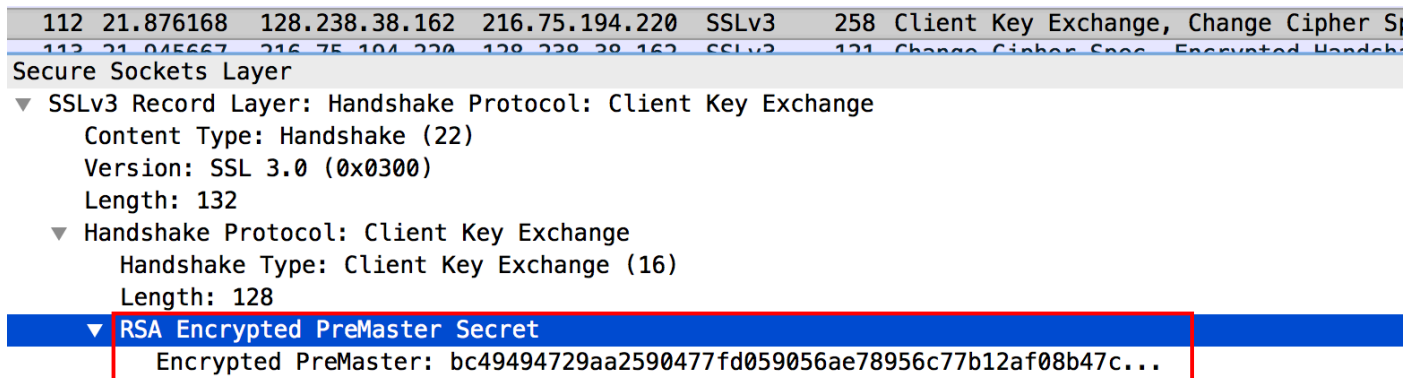

No, it does not contain the Certificate.

The certificate is in frame 111.

Furthermore, I see that the Certificate is in frame 111 only, thus it fits into a single Ethernet frame.

**[10] Locate the client key exchange record. Does this record contain a pre-master secret? What is this secret used for? Is the secret encrypted? If so, how? How long is the encrypted secret?**

Yes, it contains a Pre-Master secret.

The server and client use Pre-master secret to make a master secret

- It is used to generate session keys for MAC and encryption.

The secret is encrypted using the public key of the server, which was extracted by the client from the certificate sent by the server.

The secret has the length of 128 bytes.

**[11] What is the purpose of the Change Cipher Spec record? How many bytes is the record in your trace?**

Change Cipher Spec record is used to indicate that the SSL records' contents which is sent by the client (only data, not header) will be encrypted.

This record has the length of 6 bytes:

- 5 for the header
- 1 for the message segment.

**[12] In the encrypted handshake record, what is being encrypted? How?**

The data type contains a *fragment* of the application data stream, followed by a MAC on the fragment, then padding and padding length, are all encrypted.

**[13] Does the server also send a change cipher record and an encrypted handshake record to the client? How are those records different from those sent by the client?**

Yes, it does.

| Length: 56  |           |                |                |       |     |   |
| Handshake Protocol: Encrypted Handshake Message                       |           |                |                |       |     |   |

The Change Cipher records are the same for server and client.

The server's Encrypted Handshake record is different from the one sent by the client because:

- It contains the concatenation of all the handshake messages sent from the server rather than from the client. Otherwise the records would end up being the same.

**[14] How is the application data being encrypted? Do the records containing application data include a MAC? Does Wireshark distinguish between the encrypted application data and the MAC?**

Application data is encrypted using Symmetric Key encryption algorithm chosen in the handshake phase (in this case is RC4) using the keys generated using the Pre-master key and nonces from both client and server.

The client encryption key is used to encrypt the data being sent from client to server and the server encryption key is used to encrypt the data being sent from the server to the client.

**[15] Comment on and explain anything else that you found interesting in the trace.**

I see that the frame 106 uses SSLv2 protocol, and the later frames use SSLv3.
